To whom it may concern,

I'm excited to apply for the Senior Language Engineer position at Epic Games. I read the Verse paper in graduate school, and I was glad to see a role open in my home of New York City. Currently, I work on logic programming compilers for databases, and am interested in seeing it applied in other domains.

At RelationalAI, I lead the design and implementation of extensions to our Datalog-based declarative query language. This includes an imperative, procedural-style sublanguage and a GQL-style graph pattern-matching extension. I also maintain the database engine's primary entry point, which serves roughly 100k queries per day. The work spans the "full stack" of compilers: from designing syntax based on customer feedback and working out the semantics of the language, to writing optimization passes and scaffolding the tooling and observability needed to debug all of it. In the short span of a year, my work has already been adopted by our largest enterprise customers as well as played a pivotal role in procuring new ones.

This engineering is grounded in programming languages research, much like Verse. I designed and published a probabilistic programming language for optimization under uncertainty at OOPSLA that outperforms the state of the art, and I hold a master's in computer science from Northeastern's Programming Research Lab. At Epic Games, I'm looking forward to contributing to the development of a language from theory to implementation at a scale larger than I have experienced so far. I have a proven track record of this, and would love to get to know the team.

Thank you for your consideration,
Minsung Cho
